du climat et de l'atmosphère (FCSCA)

# Study Motivation

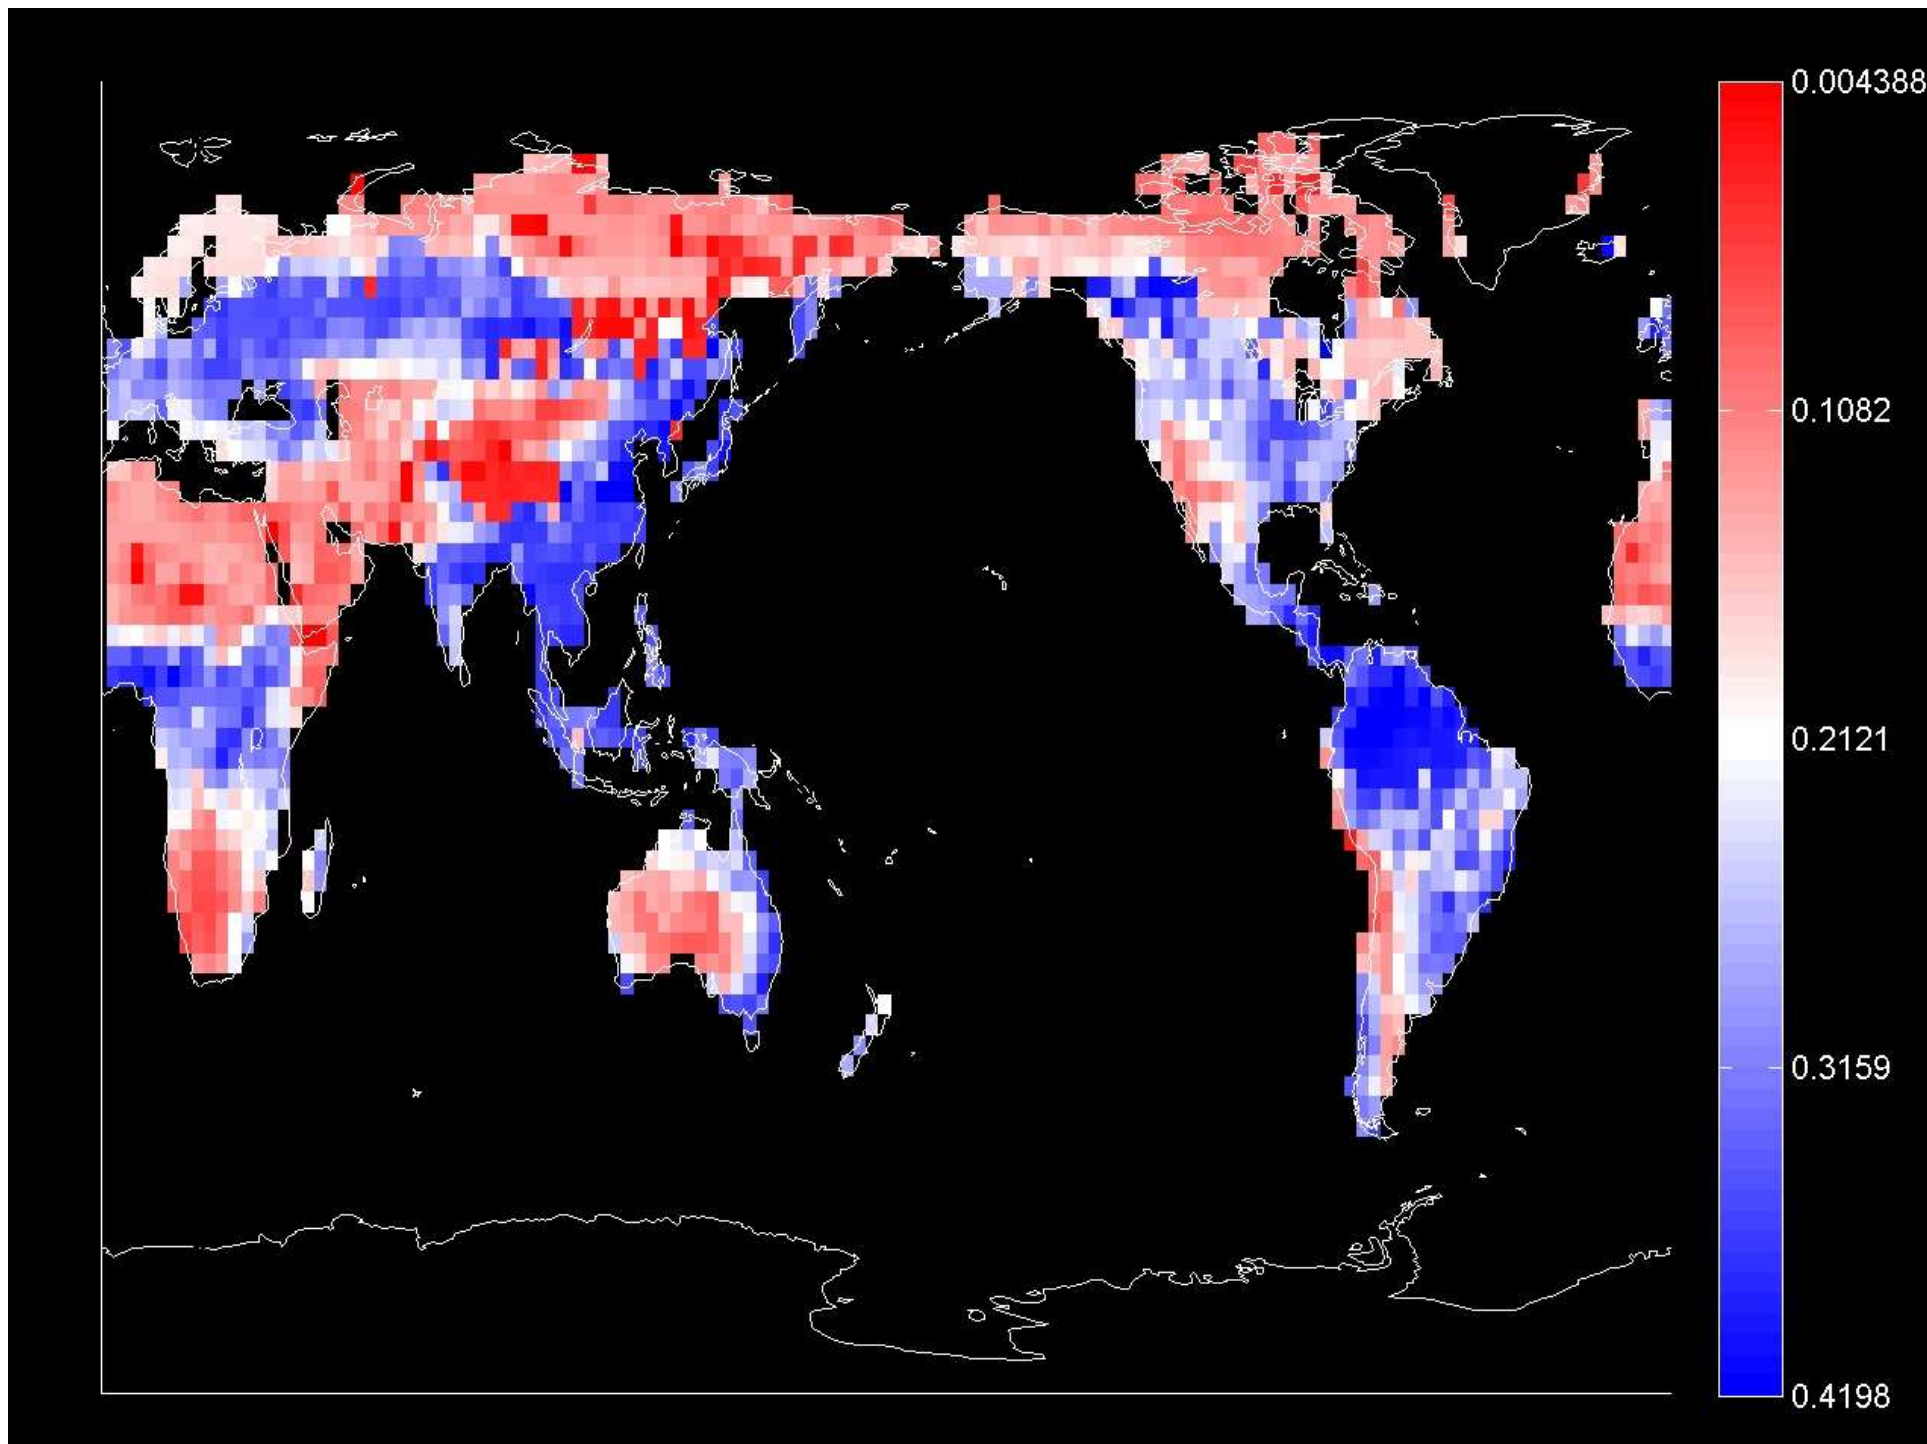

- Forecast model boundary conditions can be difficult to measure (e.g. Soil Moisture).
- SM can have a predictable behaviour weeks or months into the future.
- Realistic model SM initialization could increase forecast skill.

# Study Goal

- Examine the role of REALISTIC soil moisture initialization on seasonal forecasts
- Determine cases where such initialization improves forecasts (e.g. droughts)

# Step 1: Soil moisture data

- Calculate soil moisture over the globe using bias-corrected forcing data.
- CLASS 3.4, NCEP reanalysis data, various observational datasets.
- 2090 Grid points, 29 years, 30 minute timestep.
- 18 Land surface variables stored.

## Step 2: Forecast Experiment Model

- CCCMA 3<sup>rd</sup> Coupled Global Climate model
- T63 grid (64 x 128)
- 1986 → 2004 (19 years)
- Boreal summer start dates (April – Aug)
- 60 day forecast length
- 10 ensembles per forecast

## Step 2: Forecast Experiment model

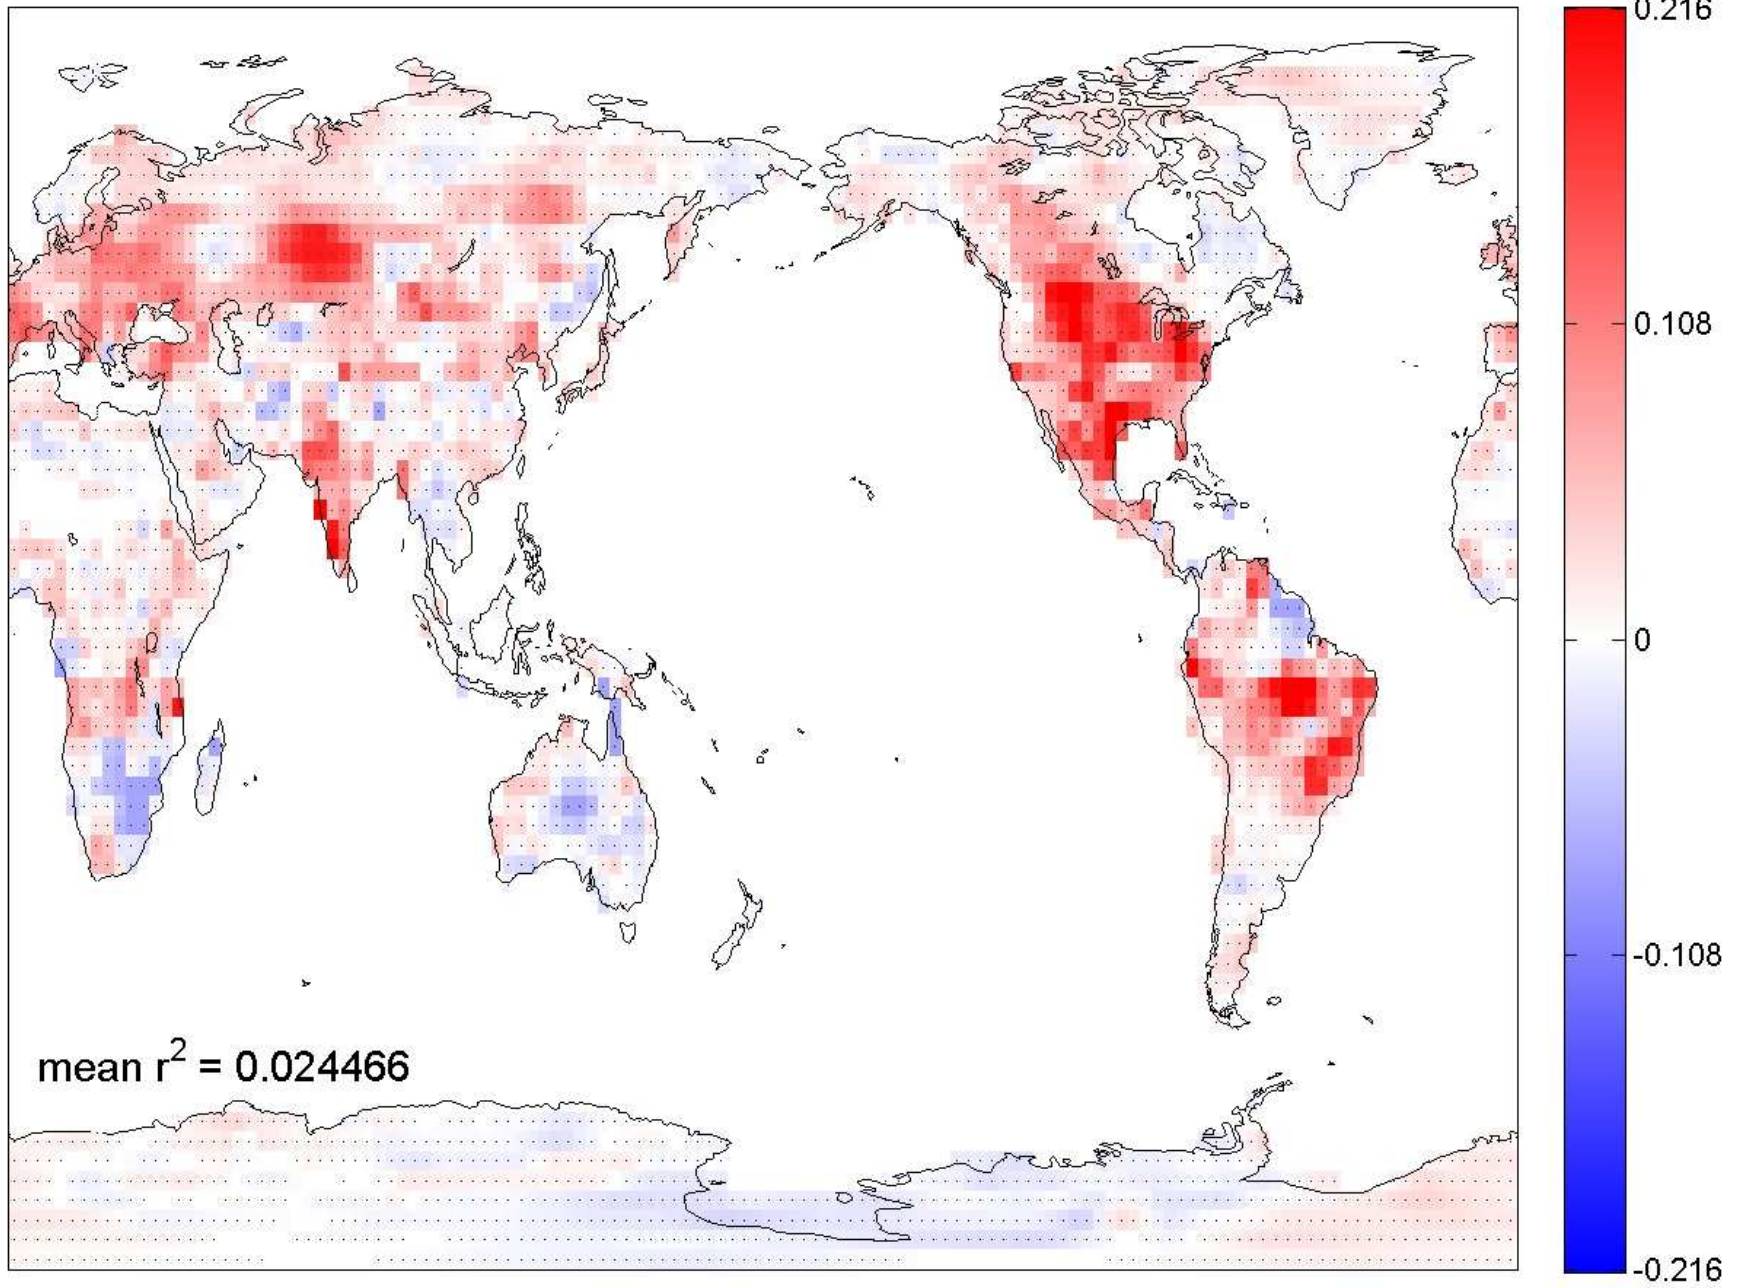

- 1 Run with realistic soil moisture initializations (SERIES 1)
- 1 Run with randomly shuffled soil moisture initializations (SERIES 2)
- Performed as part of the GLACE-2 experiment

# Step 3: Forecast Skill Assessment

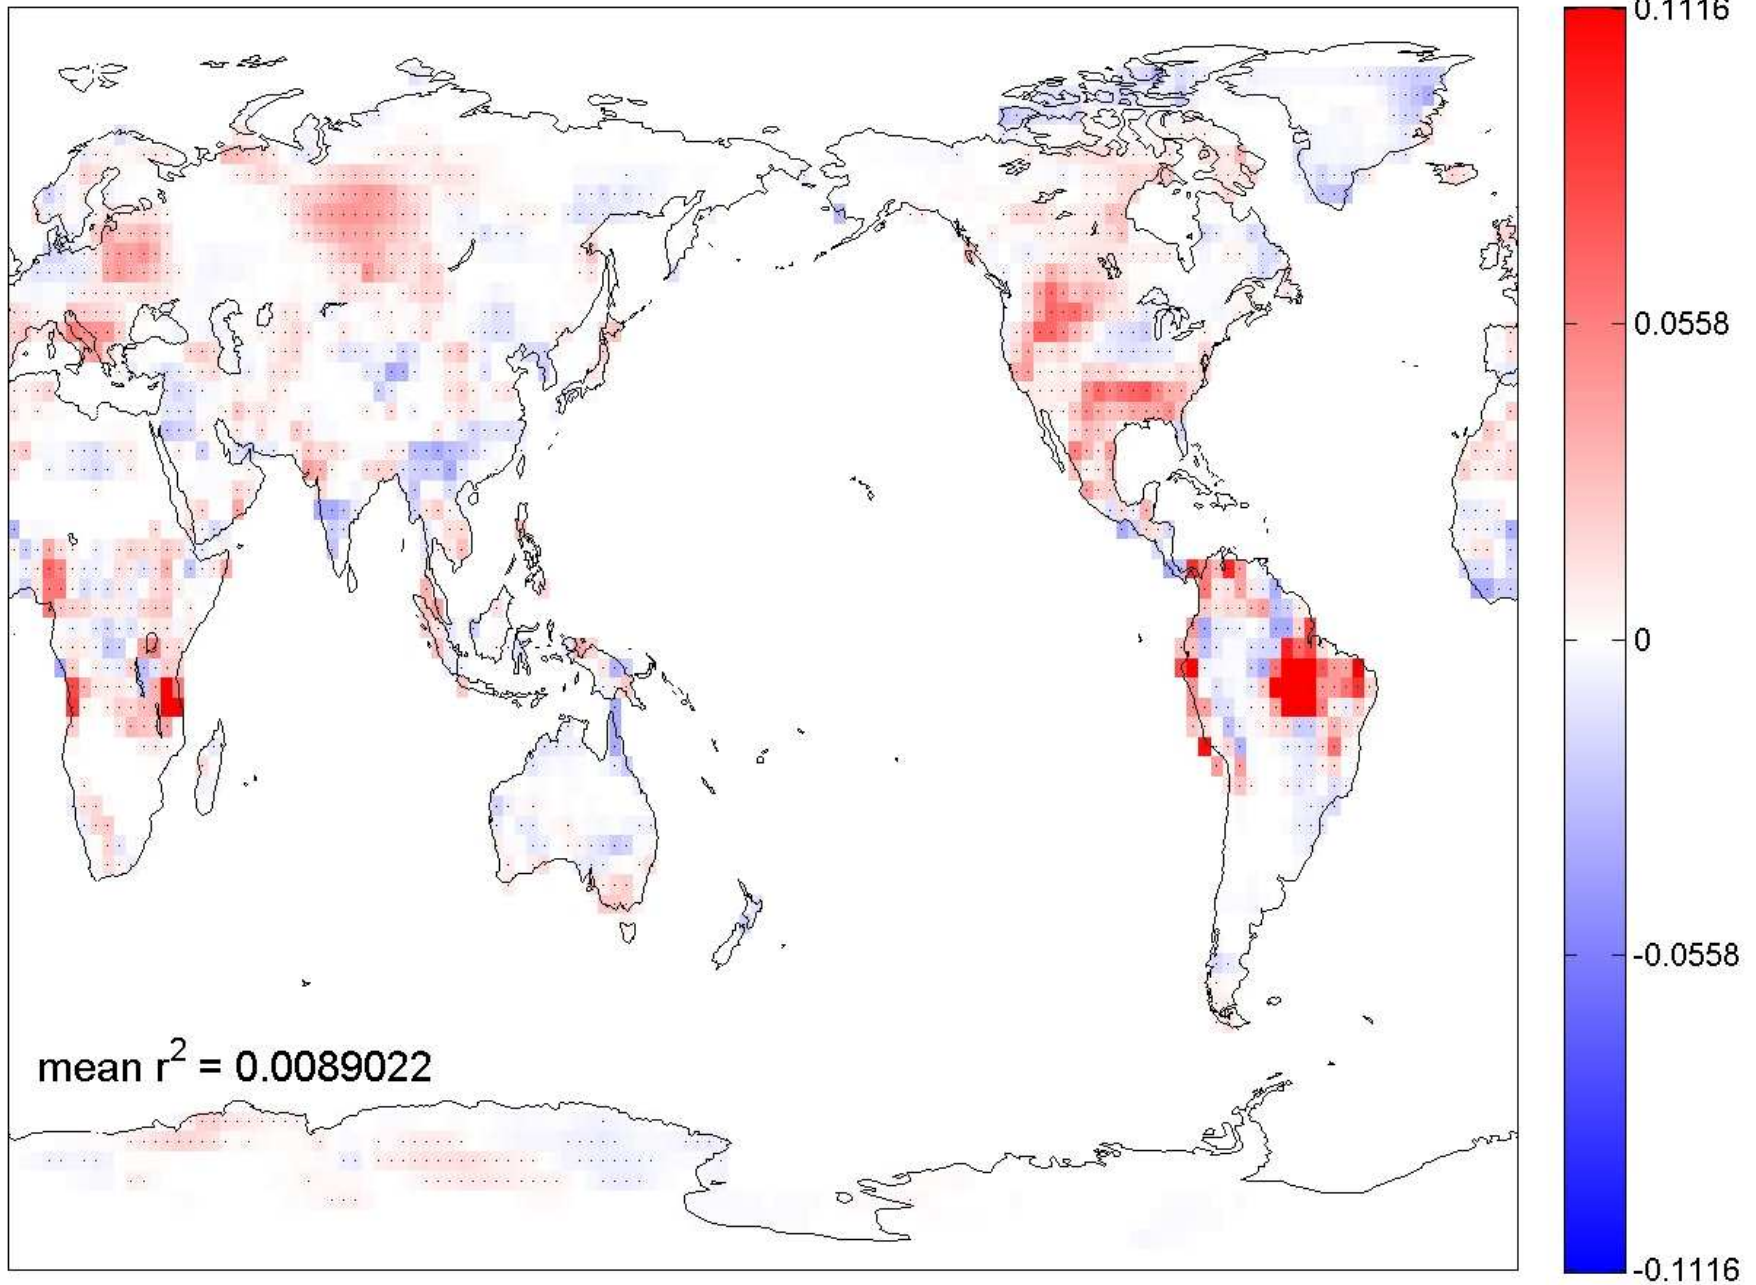

- Square of the correlation coefficient between 15-day forecast and observations (T derived from NCEP reanalysis)
- Difference in  $r^2$  between series 1 and series 2 ( $r^2_{\text{diff}}$ )
- Significance estimated with a monte-carlo simulation

CORR Jun-Aug n Temp AIR1 95 3

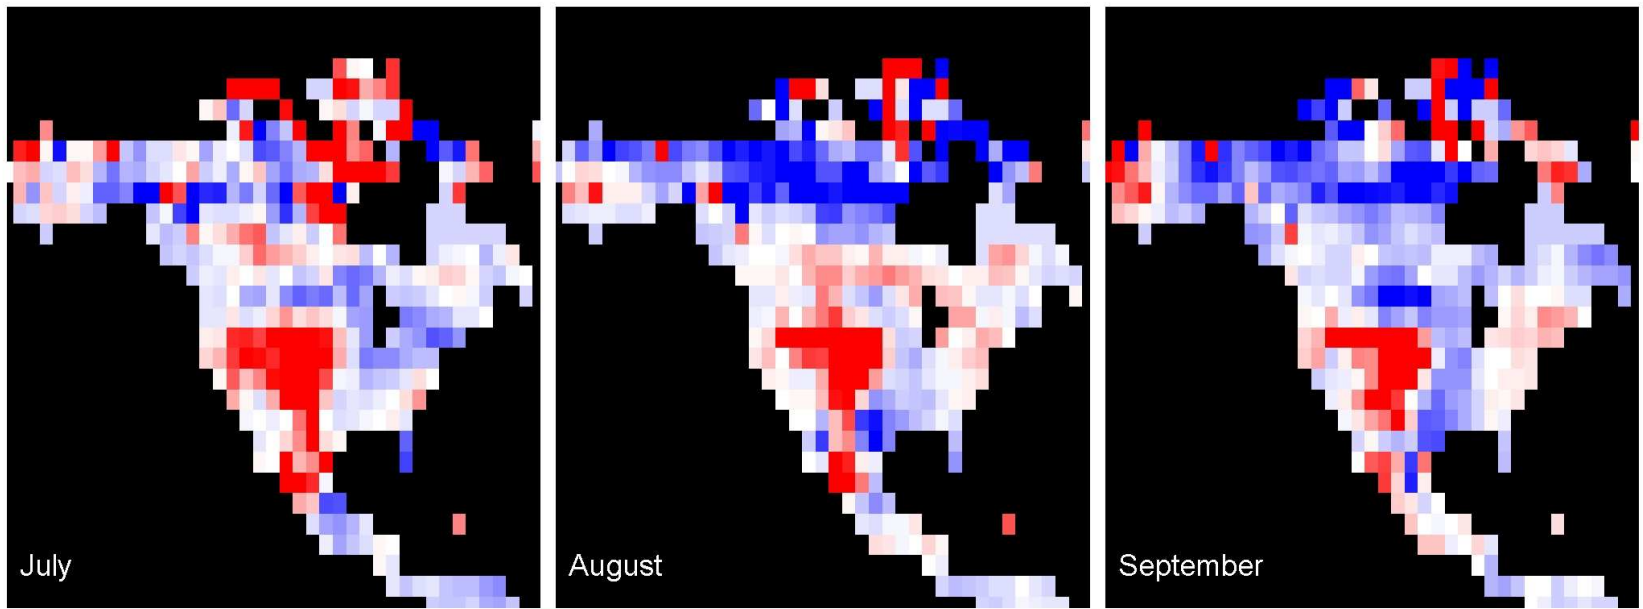

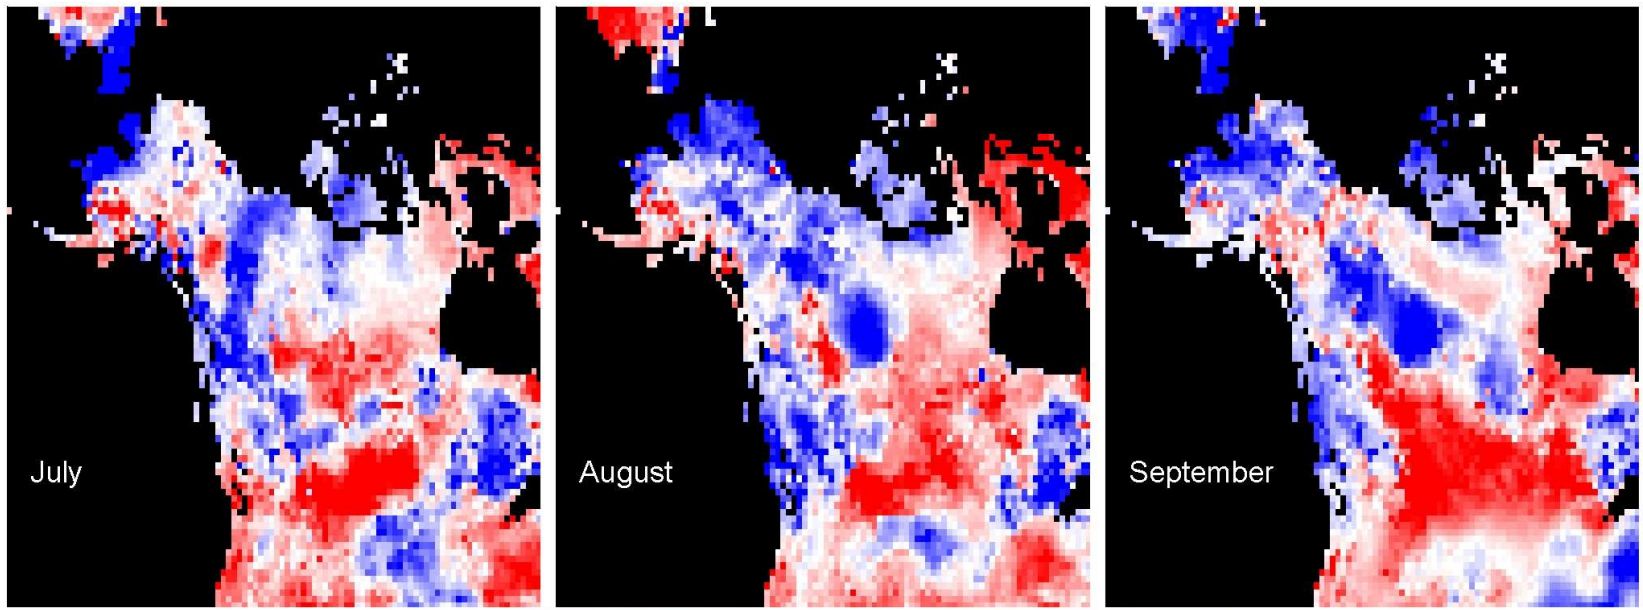

CORR Jun-Aug n Temp AIR1 95 4

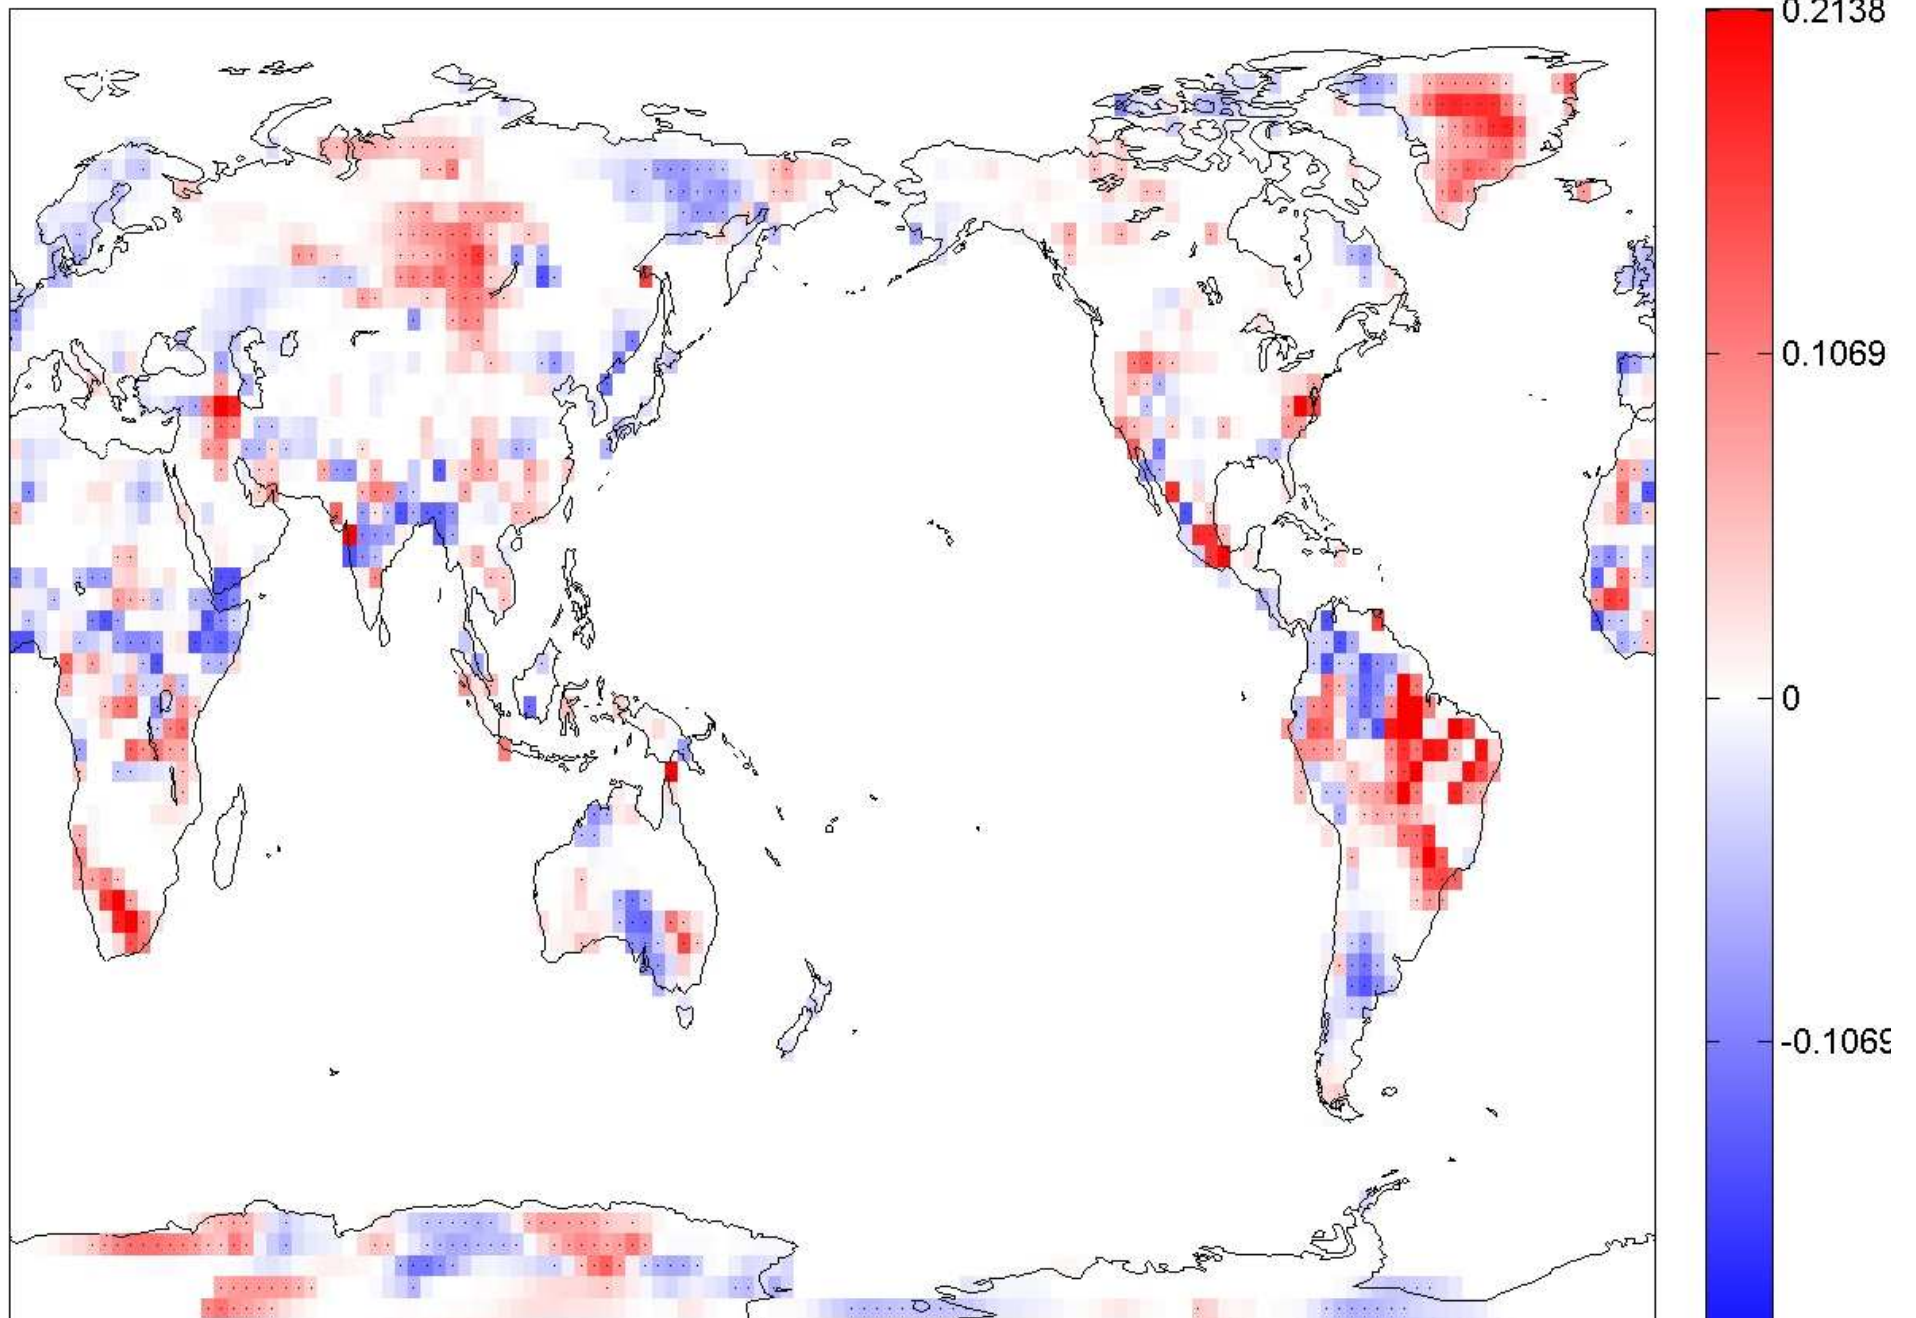

01-02 drought Jun Aug n Temp AIR1 95 2

# Step 4: Research directions

- Soil moisture / forecast skill for extreme percentiles of dry/wet conditions
- Examine periods of particular forecast skill in regions to see what contributed to that success
- Examine variability of soil moisture in particular areas (e.g. Canadian Prairies)

The end

Thank you
