# Review and Discussion of Theme II

**Bill Merryfield**

**Canadian Centre for Climate Modelling and Analysis**

**Environment Canada**

GOAPP Workshop 31 May 2010 *Ottawa*

# Theme II: Seasons to Decades

- **Sub-Theme II.1 Analysis and Mechanisms**

*What are the origins of predictability?*

- **Sub-Theme II.2 Predictability of the Coupled System**

*What are the limits of predictability?*

- **Sub-Theme II.3 Prediction**

*How well can we predict in practice?*

## Sub-Theme II.2 Predictability of the Coupled System

### ***21st Century decadal potential predictability***

*Boer 2010 (submitted)*

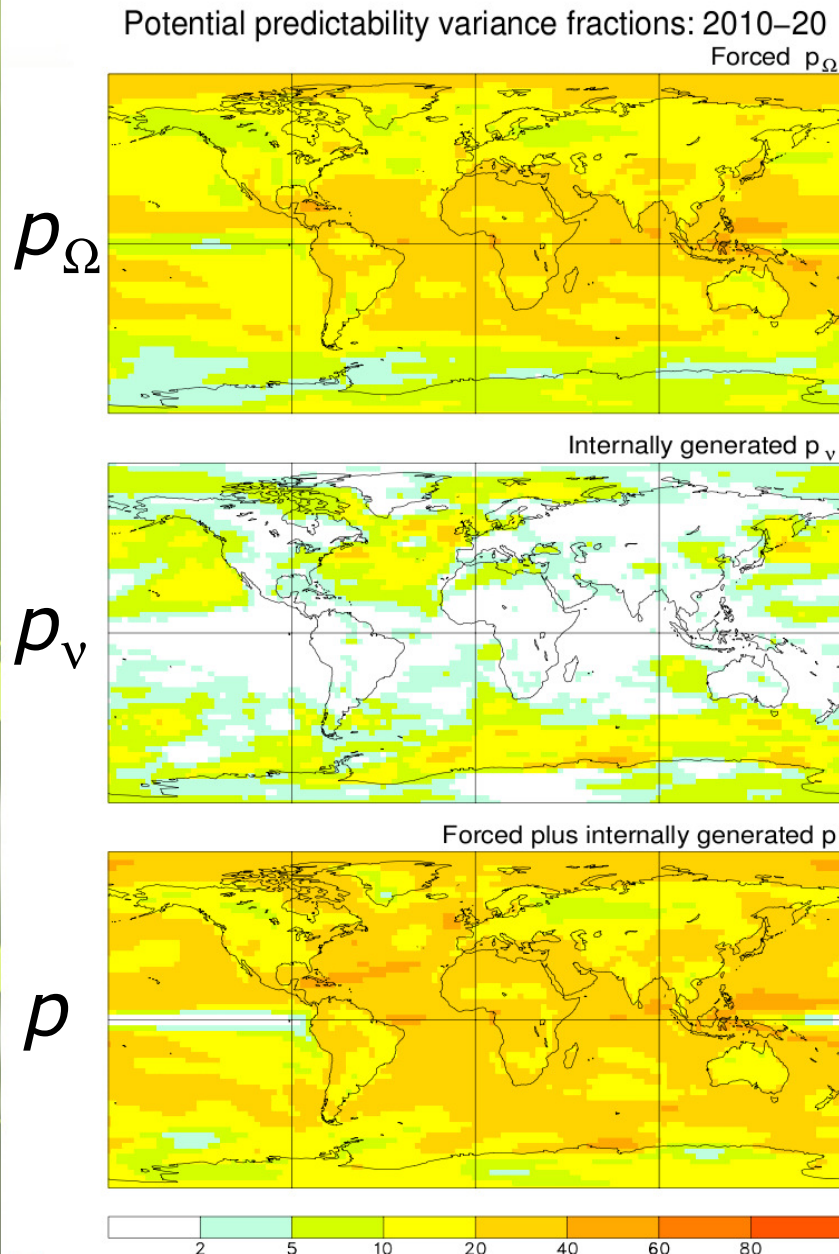

- Climate variables with *forced component* have associated variances
$$\sigma^2 = \sigma^2_{\Omega} + \sigma^2_v + \sigma^2_{\varepsilon}$$
- $\Omega$  is long timescale *externally forced* variability
  - obtained by fitting 2<sup>nd</sup> order orthogonal polynomial
- $v$  is long timescale *internally generated* variability
- $\varepsilon$  is short timescale *unpredictable “noise”* variability
- statistics pooled across models

- **Potential predictability variance fraction** has two components

$$p = (\sigma^2_{\Omega} + \sigma^2_v) / \sigma^2 = p_{\Omega} + p_v$$

# Potential predictability of temperature for 2010-20 ("next decade")

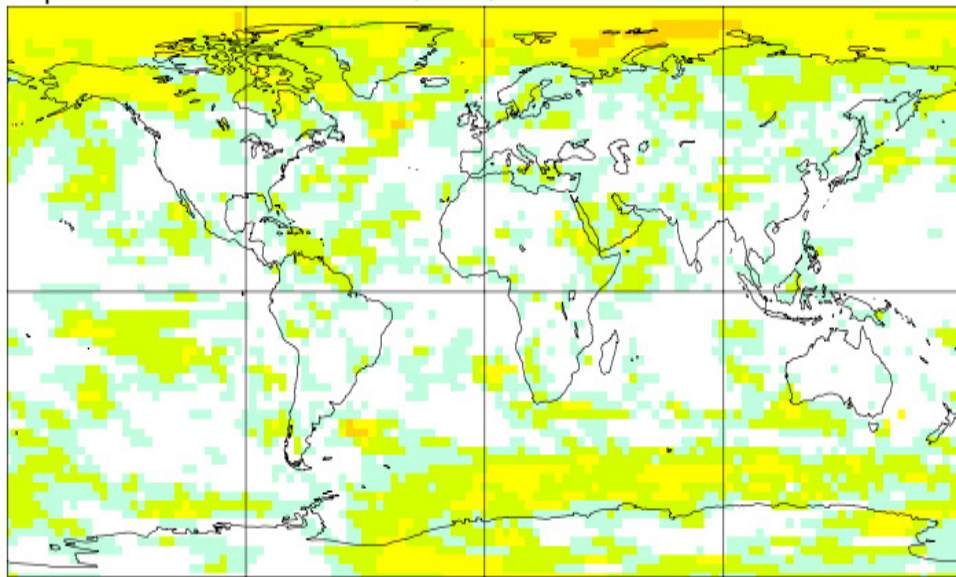

- percentage of total variance over decade
  - associated with forced component
  - associated with internal variability
- $p_{\Omega}$  and  $p_{\nu}$  tend to be inverses of one another so  $p = p_{\Omega} + p_{\nu}$  is more uniform than either

# Potential predictability of precipitation

Potential predictability of precipitation: 2020-30 (i.e. for *second* decade)

- *due to forced component*
- noise variance for precipitation is large
- internally generated  $p_v$  is small as a result
- only *multi-decade*  $p_{\Omega 1}$  contributes and then only modestly

# Potential seasonal predictability of Summer Asian-Australian Monsoon at NCEP Coupled Model (Yang and Tang, CMOS talk)

Tue 12:15

$$MI = -\frac{1}{2} \left\langle \ln \left( \frac{\sigma_p^2}{\sigma_q^2} \right) \right\rangle$$

**“Mutual information”**

$$MSESS = 1 - \frac{MSE}{MSE_{clim}} = 1 - \frac{\langle (f - o)^2 \rangle}{\text{var}(o)}$$

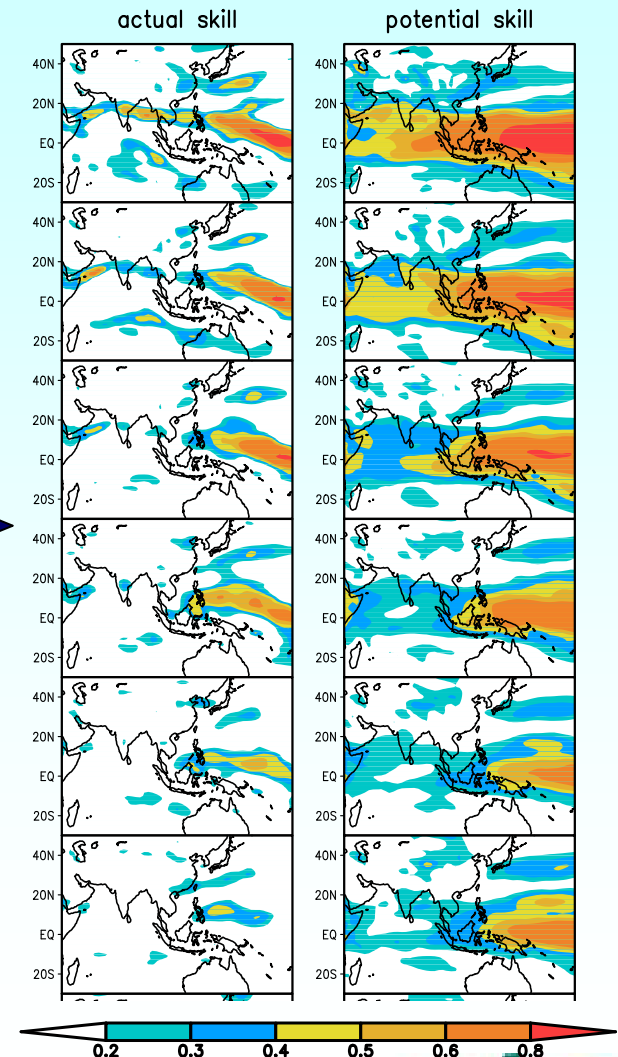

**Potential skill**

**Actual skill**

U850 prediction skill at lead times from 1 month (top) to 6 months (bottom) →

## Conclusions

- (1) The **potential skill is larger than actual skill**, indicating the possibility of skill improvement after model development.
- (2) Potential skill has a better relationship with actual skill for correlation than for MSESS.
- (3) Potential predictability is dominated by normalized ensemble mean shift.

# Sub-Theme II.3 Prediction

## II.3.1 Coupled Model Initialization

Estimating Model Errors in an EnKF Assimilation System of Argo profiles (Deng and Tang, CMOS talk).

Ocean Model:OPA/NEMO 0.5°

Wed 11:00

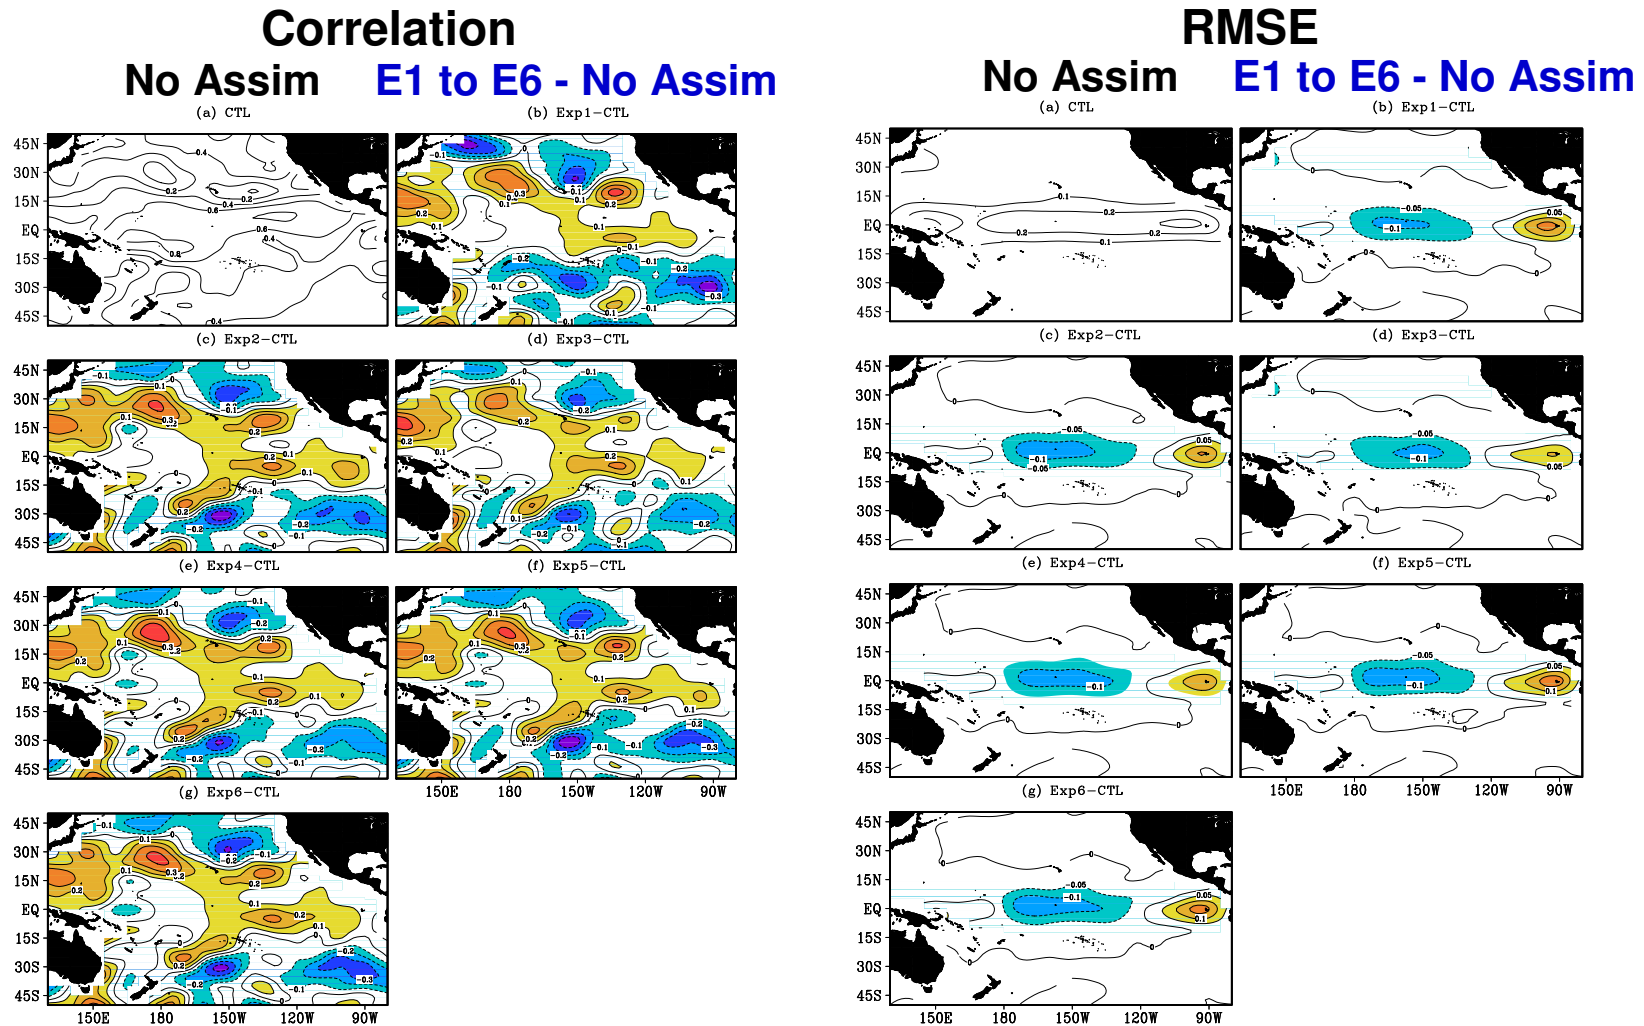

Exps	Model error	inflator	bias	Bias Correction
E1	0	0	0	no
E2	1	0	0	no
E3	0	Adaptive	0	no
E4	1	Adaptive	0	0
E5	1	Adaptive	1	Dee's
E6	1	Adaptive	1	Persistent

**0:** without consideration in EnKF;

**1:** consideration in EnKF

# Surface Zonal Current

All experiments increase correlation and reduce RMSE of surface zonal current in the tropical Pacific Ocean (30S-30N), especially in the central equatorial Pacific Ocean.

E2, E4-E6 are superior to E1 and E3, so additive error method is superior to the covariance inflation in EnKF. However the differences between the 6 experiments are not significant

## II.3.2 The Coupled Model Historical Forecasting Project

## II.3.4 Sensitivity of Seasonal Climate Forecasts in the CCCma GCM to the Initialization of Land Surface Hydrological States

- CanCM3/4 CLASS land surface model forced off-line with bias-corrected reanalysis fields
- This land surface *analysis* (not realizable in real time) provides
  - I.C. for sensitivity experiments to assess the role of land-surface initialization (including soil moisture) in forecast skill  
→ **GLACE-2**
  - benchmark for assessing quality of operational forecast IC

## Sub-Theme II.3 Prediction

### II.3.3 Forecast Combination, Calibration and Verification

**Carlos Gaitan** (Ph.D. student under **W. Hsieh**, UBC):

#### **Statistical Downscaling:**

##### Predictors

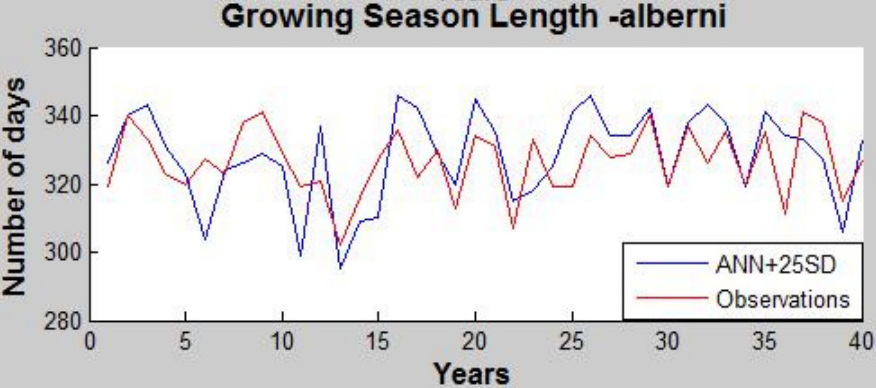

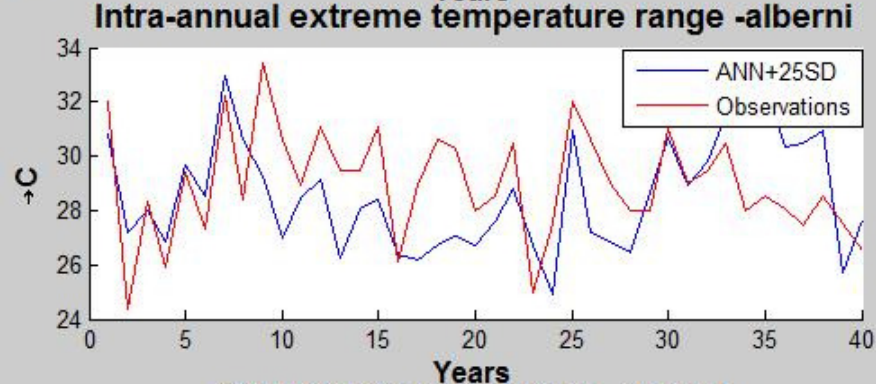

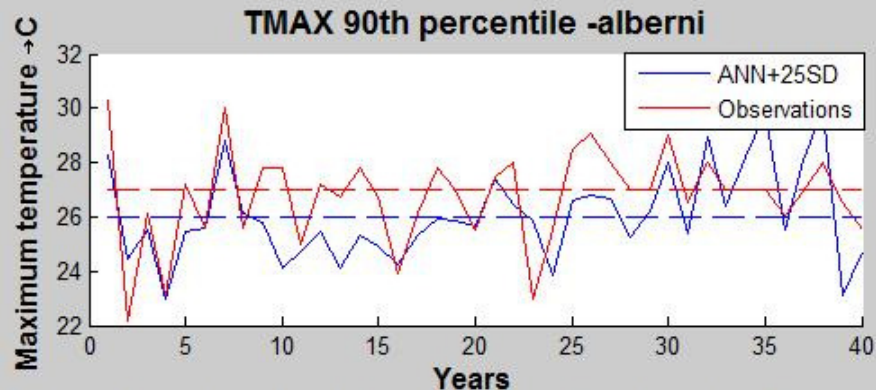

- Canadian Global Climate Model version 3 (CGCM 3.1)
  - 21<sup>st</sup> century emission Scenarios
    - A2
    - A1B
- NCEP/NCAR Reanalysis (1961-2000)

##### Predictands

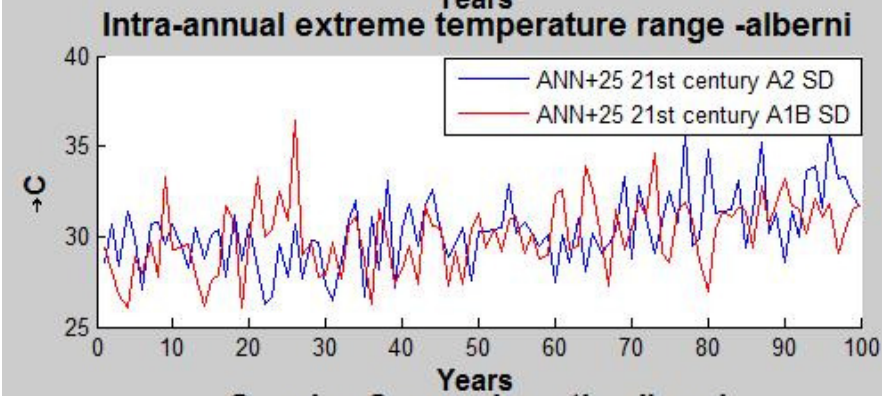

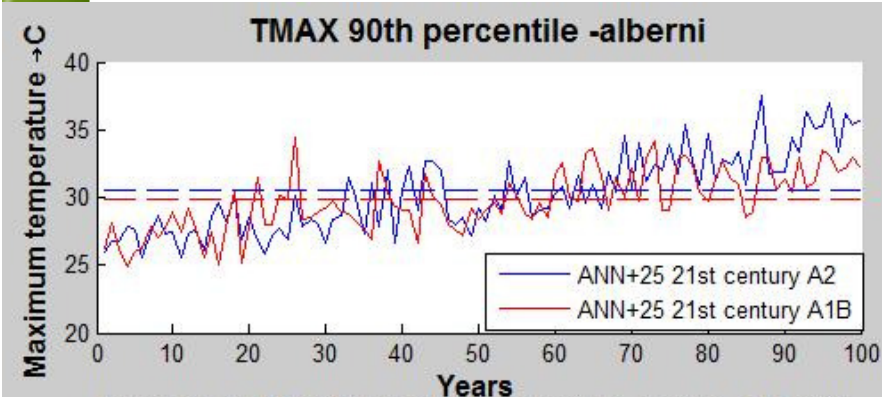

- Daily station values of:
  - Maximum temperature (TMAX)
  - Minimum temperature (TMIN)

# STARDEX INDICES (1961-2000): DOWNSCALE USING ARTIFICIAL NEURAL NETWORK MODEL WITH 25 PREDICTORS (ANN+25)

# PROJECTION TO 2001-2100 BY “ANN+25” MODEL: STARDEX INDICES

# Conclusions

*Since October 2006, Theme II research has*

- Clarified the relation between intrinsic and tropically forced North Pacific variability in climate models
- Quantified potential predictability in stationary, warmer, and warming climates
- Developed an effective and operation-ready coupled seasonal-to-interannual prediction system for Canada
- Explored the application of this forecast system to decadal-multidecadal prediction
